

EXERCISE 2 PROBLEMS/SOLUTIONS—PART I

1. Using a globe, determine the latitude and longitude (to the nearest degree) of the following cities. Be sure to indicate if the location is north or south latitude, and east or west longitude.

| | <u>City</u> | <u>Latitude</u> | <u>Longitude</u> |
|-----|-------------------------|-----------------|------------------|
| (a) | Chicago, Illinois | <u>42° N</u> | <u>88° W</u> |
| (b) | Tokyo, Japan | <u>35° N</u> | <u>140° E</u> |
| (c) | Sydney, Australia | <u>35° S</u> | <u>151° E</u> |
| (d) | Singapore | <u>1° N</u> | <u>104° E</u> |
| (e) | Buenos Aires, Argentina | <u>35° S</u> | <u>58° W</u> |

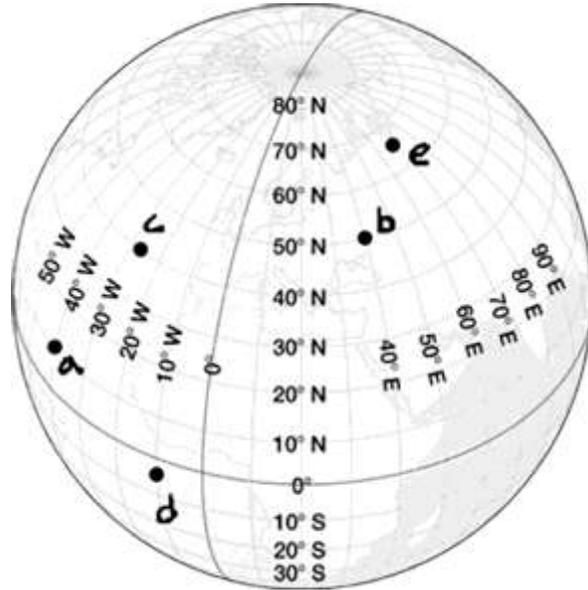

2. Using a globe, determine which major city is located at the following coordinates:

| | <u>Latitude</u> | <u>Longitude</u> | <u>City</u> |
|-----|-----------------|------------------|---------------------------|
| (a) | 14° N | 100° E | <u><i>Bangkok</i></u> |
| (b) | 56° N | 38° E | <u><i>Moscow</i></u> |
| (c) | 19° N | 99° W | <u><i>Mexico City</i></u> |
| (d) | 1° S | 37° E | <u><i>Nairobi</i></u> |
| (e) | 37° S | 175° E | <u><i>Auckland</i></u> |

3. (a) What is the latitude and longitude of your school (estimate to the nearest minute of latitude and longitude; be sure to indicate if the location is north or south latitude, and east or west longitude)?
- (b) What resources did you use to determine this?

EXERCISE 2 PROBLEMS/SOLUTIONS—PART II

1. On the diagram at right, plot the following coordinates with a dot. Then label each dot with its corresponding letter:

- (a) 10° N, 40° W
- (b) 50° N, 40° E
- (c) 40° N, 25° W
- (d) 5° S, 10° W
- (e) 65° N, 70° E

2. Use the index of an atlas to find the following places. Determine the latitude and longitude to the nearest degree:

| <u>Place</u> | <u>Latitude</u> | <u>Longitude</u> |
|-----------------------------|-----------------|------------------|
| (a) Pusan | <u>35° N</u> | <u>129° E</u> |
| (b) Reykjavik (Reikjavik) | <u>64° N</u> | <u>22° W</u> |
| (c) Walvis Bay | <u>23° S</u> | <u>14° E</u> |
| (d) Tuvalu (Ellice Islands) | <u>8° S</u> | <u>177° E</u> |

3. If you start at the equator and travel to 10° N latitude, approximately how many kilometers (or miles) north of the equator will you be? Take the circumference of the Earth to be 40,000 kilometers (24,900 miles). Show your calculations.

$40,000/360 = 111.1 \text{ km/degree} = 1111 \text{ km (approx. 1100 km)}$
 $24,900/360 = 69.2 \text{ mi./degree} = 692 \text{ mi. (approx. 690 mi.)}$

4. If you travel west through 10° of longitude along the equator, the distance traveled will be very different from the distance traveled through 10° of longitude at 60° N latitude. Why?
Meridians converge toward the poles and so are closer together at 60° N than at 0°.
